Art Unit: 2137

DETAILED ACTION

Page 2

1. Claims 1-13 and 15-27 are pending.

2. Amendment filed 04/20/2006 has been received and considered.

Claim Rejections - 35 USC § 103

- 3. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
- 4. Claims 1-4, 6-9, and 15-27 are rejected under 35
 U.S.C. 103(a) as being unpatentable over Wiser et al (US 6385596), in view of Hardjono (US 6182214), in view of Johnston (US 6373946), in view of Arnold (US 6175924) and in view of Nakagawa (US 20020016775), further in view of Chang (US 6922735).

As per claim 1, Wiser et al discloses a method of controlling content usage in a communication device using a decryption key, the method comprises: providing the communication device a first key in response to a request for content; and verifying credit of a user of the personal communication device; providing the personal communication device a key when the credit is confirmed; for use in decrypting content (see column 4 lines 13-67).

Wiser et al fails to disclose the decryption key being broken into key-shares one of which is pre-stored on the device.

However Hardjono teaches the use of key-shares and prestoring one on a device (see column 3 lines 33-42).

At the time of the invention it would have been obvious to a person of ordinary skill in the art to distribute one of Hardjono's key-shares to each of the servers and users of Wiser et al to be delivered to the use upon request and confirmation of credit.

Motivation to do so would have been to set up a threshold cryptography system (see Hardjono column 3 lines 29-42).

The modified Wiser et al and Hardjono system fails to disclose the communications device is wireless.

However, Johnston teaches such wireless devices (see abstract).

At the time of the invention it would have been obvious to a person of ordinary skill in the art for the modified Wiser et al and Hardjono system's communications device to be wireless.

Motivation to do so would have been to communicate using satellite mobile telecommunications (see Johnston abstract).

The modified Wiser et al, Hardjono, and Johnston system fails to disclose the device having two processors and purging a key share when usage exceeds a measurement.

However, Arnold teaches a device with two processors and an authentication code (see figures 1 and 3); and Nakagawa teaches monitoring usage of content (see paragraphs 36-41).

At the time of the invention it would have been obvious to a person of ordinary skill in the art for the modified Wiser et al, Hardjono, and Johnston system to have two processors and monitor usage.

Motivation to do so would have been to protect secure memory (see Arnold column 2 lines 15-36) and to protect copyrights (see Nakagawa paragraph 11).

The modified Wiser et al, Hardjono, Johnston, Arnold and Nakagawa system fails to disclose the two or more processors are located on a single integrated circuit to prevent unauthorized interception of the content communicated between the processors.

However, Chang teaches the use of a single integrated circuit with two or more processors (see column 2 lines 44-62) and it is an inherent feature that when on a single integrated circuit the interception of communications is inhibited.

At the time of the invention it would have been obvious to a person of ordinary skill in the art to include the multiple processor of the modified Wiser et al, Hardjono,

Johnston, Arnold and Nakagawa system on a single integrated circuit.

Art Unit: 2137

Motivation to do so would have been to provide efficient communications (see Chang column 2 lines 3-10).

As per claim 7, the modified Wiser et al, Hardjono, Johnston, Arnold, Nakagawa, and Chang system discloses a keyshare pre-stored on a SIM combined to create a decryption key (see Johnston column 9 lines 14-21).

As per claim 8, the modified Wiser et al, Hardjono,

Johnston, Arnold, Nakagawa, and Chang system discloses the

verifying credit of the user and the providing the second of the

key-shares to the personal communication device are performed by

a finance server in communication with the personal

communication device (see Wiser et al column 4 lines 13-67 and

figure 1).

As per claim 9, the modified Wiser et al, Hardjono,
Johnston, Arnold, Nakagawa, and Chang system discloses
generating the key-shares from the decryption key using a keysplitting technique (see Hardjono column 3 lines 29-42).

As per claim 15, the modified Wiser et al, Hardjono, Johnston, Arnold, Nakagawa, and Chang system discloses prestoring the key-share before a request is sent (see Hardjono column 3 lines 29-42).

As per claim 4, the modified Wiser et al, Hardjono,

Johnston, Arnold, Nakagawa, and Chang system discloses receiving

Art Unit: 2137

the content from a content server in a security server; encrypting the content in the security server with the encryption key and providing the encrypted content from the security server to the personal communication device over a wireless communication link (see Wiser et al column 4 lines 13-67).

As per claim 6, the modified Wiser et al, Hardjono,

Johnston, Arnold, Nakagawa, and Chang system discloses the

providing the first of the key-shares is performed by a security

server in response to either the receipt of content at the

security server or the encryption of the content by the security

server in communication with the personal communication device

(see Wiser et al column 4 lines 13-67).

As per claim 2, the modified Wiser et al, Hardjono,

Johnston, Arnold, Nakagawa, and Chang system discloses

monitoring usage of the content with a security processor of the

personal communications device; and purging a key-share when the

usage exceeds a service limit indicated by the measurement

parameters or when the authentication code fails to authenticate

(see Nakagawa paragraphs 36-41).

As per claim 3, the modified Wiser et al, Hardjono,

Johnston, Arnold, Nakagawa, and Chang system discloses receiving

the request for content from the wireless communication device,

Art Unit: 2137

the request identifying the content and the measurement parameters for the content encrypting the content where the keyshare is pre-stored in the communications device (see Wiser et al column 4 lines 13-67 as applied above).

As per claim 10, the modified Wiser et al, Hardjono, Johnston, Arnold, Nakagawa, and Chang system discloses the content comprises either video content or music content (see Wiser et al column 4 lines 13-67).

As per claims 11 and 19, the modified Wiser et al,
Hardjono, Johnston, Arnold, Nakagawa, and Chang system discloses
generating a set of measuring parameters comprising at least one
of a date-limit, a run-time limit, and an iteration limit, and
wherein the personal communication device monitors usage of the
content with respect to the measurement parameters and purges at
least one of the key-shares when the usage exceeds one of the
measurement parameters of the set (see Nakagawa paragraphs 3641).

As per claim 12, the modified Wiser et al, Hardjono,

Johnston, Arnold, Nakagawa, and Chang system discloses a content
server defining the set of measurement parameters based on
preferences of a content provider (see Nakagawa paragraphs 3641).

Art Unit: 2137

As per claim 13, the modified Wiser et al, Hardjono,

Johnston, Arnold, Nakagawa, and Chang system discloses the datelimit defines an end calendar date for playing the content, the

nm-time limit defines a maximum amount of time for playing

portions of the content, and the iteration limit defines a

maximum number of times for playing the content or portions

thereof (see Nakagawa paragraphs 36-41).

As per claims 16, 21, 24, 25 and 27, the modified Wiser et al, Hardjono, Johnston, Arnold, Nakagawa, and Chang system discloses a security processor portion to combine a plurality of key-shares and decrypt content for the processing system, the security processor portion including a monitor for usage of the content constructed and arranged to purge at least one of the key-shares when the usage exceeds a measurement parameter; and a communications processor portion to receive decrypted content from the security processor portion and providing decrypted content for playing on the wireless communication device having a third key-share pre-stored and receiving the first and second key-shares (see Wiser et al as applied above).

As per claims 17 and 22, the modified Wiser et al,
Hardjono, Johnston, Arnold, Nakagawa, and Chang system discloses
the security processor of the personal communication device
purges at least one of the key-shares when usage of the content

exceeds a service limit indicated by the measurement parameters (see Nakagawa paragraphs 36-41).

As per claim 18, the modified Wiser et al, Hardjono, Johnston, Arnold, Nakagawa, and Chang system discloses a keyshare pre-stored on a SIM combined to create a decryption key (see Johnston column 9 lines 14-21).

As per claim 19, the modified Wiser et al, Hardjono,

Johnston, Arnold, Nakagawa, and Chang system discloses

generating a set of measuring parameters comprising at least one

of a date-limit, a run-time limit, and an iteration limit (see

Nakagawa paragraphs 36-41).

As per claims 20 and 26, the modified Wiser et al,
Hardjono, Johnston, Arnold, Nakagawa, and Chang system discloses
an applications processor portion to process applications
running on the personal communication device, and wherein the
security processor portion, communications processor portion and
applications processor portion are part of a processor area and
fabricated on an application specific integrated circuit (ASIC)
(see Arnold figure 1).

As per claim 23, the modified Wiser et al, Hardjono,

Johnston, Arnold, Nakagawa, and Chang system discloses the

verifying credit of the user and the providing the second of the

key-shares to the personal communication device are performed by

Application/Control Number: 09/919,518 Page 10

Art Unit: 2137

a finance server in communication with the personal communication device (see Wiser et al column 4 lines 13-67).

5. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over the modified Wiser et al, Hardjono, Johnston, Arnold, Nakagawa, and Chang system as applied to claim 4 above, and further in view of Howard et al (US 20020069365).

As per claim 5, the modified Wiser et al, Hardjono,

Johnston, Arnold, Nakagawa, and Chang system fails to disclose
the security server and content server being separate entities.

However, Howard et al teaches a security and content server being separate (see paragraph 68).

At the time of the invention it would have been obvious to a person of ordinary skill in the art to have the security and content servers of the modified Wiser et al, Hardjono, Johnston, Arnold, Nakagawa, and Chang system to be separate as in Howard et al.

Motivation to do so would be to allow them to be owned by separate people (see Howard et al paragraph 68).

Response to Arguments

6. Applicant's arguments with respect to claims 1-13 and 15-27 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

Page 11

7. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, THIS ACTION IS MADE FINAL. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Schell et al (US 5933503) teaches pre-storing a key in a processor area.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Michael

Application/Control Number: 09/919,518 Page 12
